Pointers K&R Ch 5

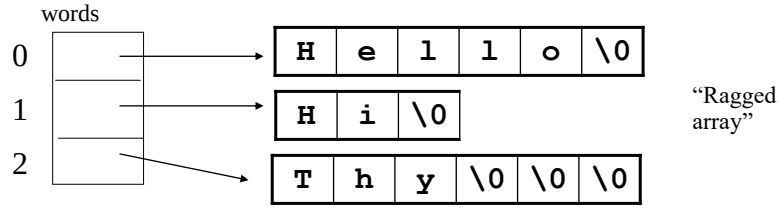
- Basics: Declaration and assignment (5.1)
- Pointer to Pointer (5.6)
- Pointer and functions (pass pointer by value) (5.2)
- Pointer arithmetic +- ++ -- (5.4)
- Pointers and arrays (5.3)
  - Stored consecutively
  - Pointer to array elements p + i = &a[i] *(p+i) = a[i]
  - Array name contains address of 1st element a = &a[0]
  - Pointer arithmetic on array (extension) p1-p2 p1<>!= p2
  - Array as function argument – "decay"
  - Pass sub_array
- Array of pointers (5.6)
- Pointer arrays vs. two dimensional arrays (5.9)
- Command line argument (5.10)
- Memory allocation (extra)
- Pointer to structures (6.4)
- Pointer to functions

YORK UNIVERSITÉ UNIVERSITY

Array of pointers to strings

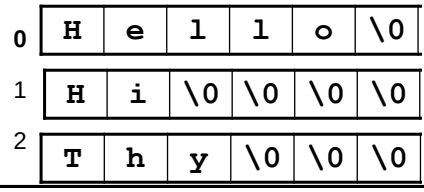
Advantage of Pointer Arrays (vs. 2D array)

```
char * words[]={"Hello", "Hi", "thy"};
```



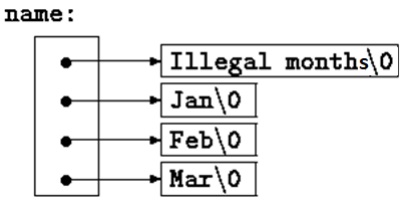
Both store table of strings. What is the difference?

```
char words[3][6] = {"Hello", "Hi", "Thy"};
```



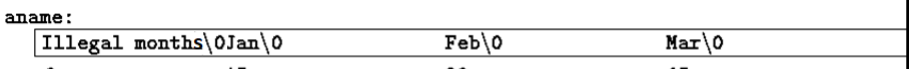
Advantage of Pointer Arrays (vs. 2D array) example 2

```
char *name[]={"Illegal months, "Jan", "Feb", "Mar"};
```



"Ragged array"

```
char aname[][15]={"Illegal months","Jan","Feb","Mar"};
```



108

Advantage of Pointer Arrays (vs. 2D array) example 3

```
char planets[][8] = {"Mercury", "Venus", "Earth",
                     "Mars", "Jupiter", "Saturn",
                     "Uranus", "Neptune", "Pluto"};
```

	0	1	2	3	4	5	6	7
0	M	e	r	c	u	r	y	\0
1	V	e	n	u	s	\0	?	?
2	E	a	r	t	h	\0	?	?
3	M	a	r	s	\0	?	?	?
4	J	u	p	i	t	e	r	\0
5	S	a	t	u	r	n	\0	?
6	U	r	a	n	u	s	\0	?
7	N	e	p	t	u	n	e	\0
8	P	l	u	t	o	\0	?	?

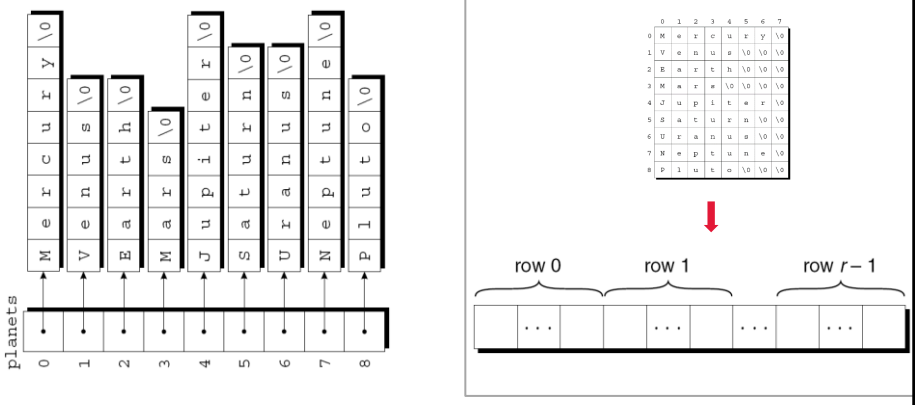
```
char *planets[] = {"Mercury", "Venus", "Earth",
                   "Mars", "Jupiter", "Saturn",
                   "Uranus", "Neptune", "Pluto"};
```

109

109

Advantage of Pointer Arrays (vs. 2D array) example 3

```
char planets[][8] = {"Mercury", "Venus", "Earth",
                     "Mars", "Jupiter", "Saturn",
                     "Uranus", "Neptune", "Pluto"};
```

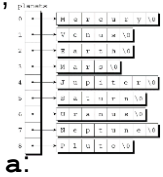


```
char *planets[] = {"Mercury", "Venus", "Earth",
                   "Mars", "Jupiter", "Saturn",
                   "Uranus", "Neptune", "Pluto"};
```

Advantage of Pointer Arrays (vs. 2D array)

```
int a[10][20];
int *b[10];
```

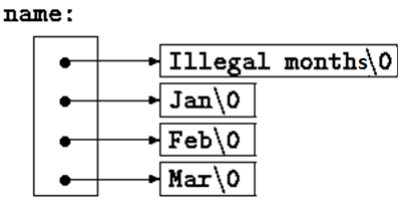
- **a**: 200 int-sized locations have been set aside.
  - Total size: 10*20*4
- **b**: only 10 pointers are allocated (and not initialized); initialization must be done explicitly.
  - Total size: 10*8 + size of all pointees



- Potential advantage of pointer array **b** vs. 2D array **a**:
  1. the rows of the array may be of different lengths (potentially saving space).
  2. Another advantage? Swap rows!

Advantage of Pointer Arrays (vs. 2D array)

```
char *name[] = {"Illegal  months", "Jan","Feb","Mar"};
```



How to swap "rows"?

sizeof name: 4*8 = 32 total memory size 4*8+15+4+4+4=59

```
char aname[][15]={"Illegal months","Jan","Feb","Mar"};
```

aname:

Illegal months\0	Jan\0	Feb\0	Mar\0
0	15	30	45

112 sizeof aname: 4*15 = 60

How to swap rows?

112

```
char planets[][8] = {"Mercury", "Venus", "Earth",
                     "Mars", "Jupiter", "Saturn",
                     "Uranus", "Neptune", "Pluto"};
```

	0	1	2	3	4	5	6	7
0	M	e	r	c	u	r	y	\0
1	V	e	n	u	s	\0	?	?
2	E	a	r	t	h	\0	?	?
3	M	a	r	s	\0	\0	\0	?
4	J	u	p	i	t	e	r	\0
5	S	a	t	u	r	n	\0	?
6	U	r	a	n	u	s	\0	?
7	N	e	p	t	u	n	e	\0
8	P	l	u	t	o	\0	?	?

```
for(i=0; i<9; i++)
  printf("%s",arr[i]);
```

```
"Mercury"
"Venus"
"Earth"
"Mars"
...
```

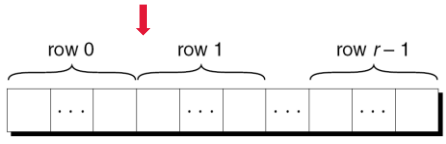
```
"Venus"
"Mercury"
"Earth"
"Mars"
..."
```

Sort 

113

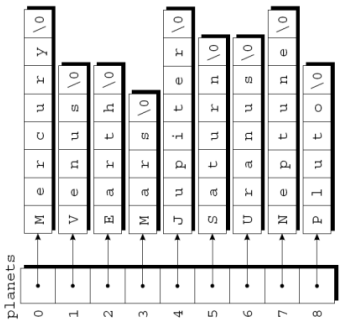
113

```
char planets[][8] = {"Mercury", "Venus", "Earth",
                     "Mars", "Jupiter", "Saturn",
                     "Uranus", "Neptune", "Pluto"};
```



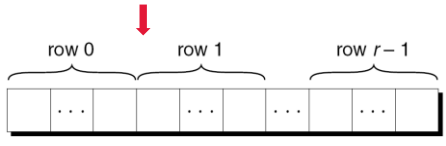
How to swap 1st 2nd row?

```
char tmp[8];
tmp = planets[0]
planets[0] = planets[1]
planets[1] = tmp;
```



```
char *planets[] =
{"Mercury", "Venus", "Earth",
   "Mars", "Jupiter", "Saturn",
  "Uranus", "Neptune", "Pluto"};
```

```
char planets[][8] = {"Mercury", "Venus", "Earth",
                     "Mars", "Jupiter", "Saturn",
                     "Uranus", "Neptune", "Pluto"};
```

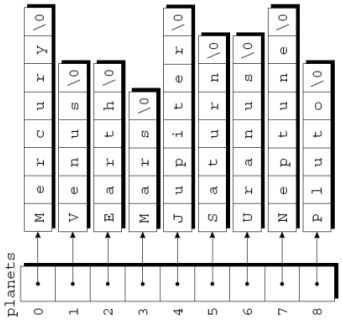


How to swap 1st 2nd row?

~~`char tmp[8];`~~
~~`tmp = planets[0]`~~
~~`planets[0] = planets[1]`~~
~~`planets[1] = tmp;`~~

```
strcpy(tmp,planets[0]);
strcpy(planets[0],planets[1]);
strcpy(planets[1],tmp);
```

O(n)



```
char *planets[] =
{"Mercury", "Venus", "Earth",
   "Mars", "Jupiter", "Saturn",
  "Uranus", "Neptune", "Pluto"};
```

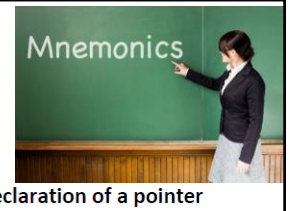
YORK UNIVERSITÉ UNIVERSITY



As mentioned in the textbook and class, the declaration of a pointer related variable is intended as a *mnemonic* (means 'it helps you memorize things'). For example, declaration `int *ptr;` can be interpreted as "expression `*ptr` is an `int`" -- thus `ptr` is an integer pointer.

Following this rule, what is the type that `argv` is declared to be?

```
int main(int argc, char *argv[])
{……}
```

YORK UNIVERSITÉ UNIVERSITY

Command-Line Arguments (5.10)
(Program arguments)

- Up to now, program interacts with user (i.e., receives user input) from stdin, using **`getchar, scanf`**, **`fgets`**, etc.
- Are there other ways?
- Program can take arguments.

```
int main(int argc, char *argv[])
```

```
public static void main(String[] args)
```

Command-Line Arguments (5.10)
(Program arguments)

- Up to now, we defines main as **`int main()`**
- Usually it is defined as

```
int main(int argc, char *argv[])
```

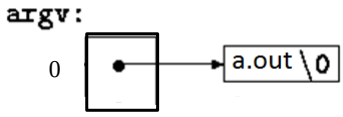
  - **`argc`** is the number of arguments (including program name)
  - **`argv`** is an array containing the arguments.
  - **`argv[0]`** is a pointer to a string with the program name. So **`argc`** is at least 1. (Java?)
  - **`Optional arguments:`** **`argv[1] ~~ argv[argc-1]`**

Can any name

Command-line arguments (program arguments)

- red 421 % **a.out**
  argv[0]: a.out

  argc: 1

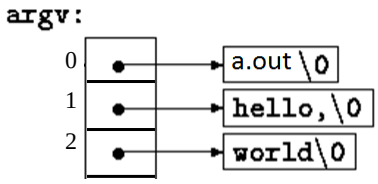


1 arg

- red 421 % **a.out hello, world**
  argv[0]: a.out
  argv[1]: hello,
  argv[2]: world optional

  argc: 3

3 args



133

```
public static void main(String[] args)
```

Different from Java

No argc why?
